

Trezor Model T short tutorial

There are two things that you are supposed to do before you can use the Trezor Model T.

- 1) You have to download Trezor bridge – a special program that allows you to actually communicate between your browser and your Trezor itself. The program works on Chrome and Mozilla browsers only. Use the following URL address: <https://wallet.trezor.io/#/> and select the operation system on which your computer works.

Then click the Download latest Bridge 2.0.19 button and install Bridge. Subsequently a new dialog window will open, and you will be asked to connect your Trezor and click the button Check for devices. Select Model T.

Now Bridge will be already installed on your computer.

- 2) However, you will need to install a new firmware that is adjusted for Capricoin. The firmware will be available latest from October 2018
